3Q26 Emerging Rare Disease Earnings Preview and Upcoming Catalysts

October 12, 2026

- **Bottom Line: We preview 3Q26 earnings across our Emerging Rare Disease coverage, where shares have meaningfully underperformed the broader biotech sector YTD.** Commercial-stage names (PTCT, RYTM, and SRRK) are down >11% YTD (vs. +26% YTD for XBI), reflecting growing investor concerns around launch execution and commercial outlooks.
- Meanwhile, earlier-stage names (LRMR, CAMP, and BNTC) have faced even greater pressure (~-34% YTD), driven by regulatory uncertainty for LRMR and BNTC and waning investor appetite for early-stage assets lacking clinical validation, such as CAMP. We believe the recent weakness has created attractive risk/reward opportunities across our earlier-stage names, with current valuations underappreciating their underlying clinical and commercial potential.

Regarding commercial names in our coverage (see pg. 5 for additional details):

- **PTCT:** The stock came under pressure amid concerns that U.S. Sephience growth could moderate as the launch shifts toward the more gradual conversion of Kuvan-treated patients. We model 3Q26 global sales of $164M (+8% QoQ), slightly below consensus of $166M. Importantly, management remains bullish on the opportunity and indicated that the company remains on track to reach +$2B in global peak sales.
- **RYTM:** We raised our 3Q26 sales estimate to $85M (in line with consensus) and our 2026E forecast to $321M (vs. $319M for consensus) following positive payer feedback on the reimbursement outlook of setmelanotide in acquired hypothalamic obesity (see our prior note HERE).
- **SRRK:** We don't model any sales for Isembyld in spinal muscular atrophy (SMA) in 3Q26 as it was just approved on September 11.

Regarding near-term catalysts:

- Phase 1 data of **SRRK's SRK-439** in healthy volunteers by year end.
- CHMP opinion on **SRRK's apitegromab** in SMA in 1H27

Reason for report:
PREVIEW

S&P 500 Health Care Index:	**1,992.60**

LEERINK PARTNERS

- Pivotal trial design of **BNTC's BB-301** in oculopharyngeal muscular dystrophy (OPMD) in 1Q27.
- Completion of rolling BLA submission of **LRMR's nomlabofusp** in Friedreich's ataxia by year-end.
- FDA engagement for **PTCT's votoplam** to discuss PIVOT-HD results.
- BLA submission completion of **PTCT's ST-920** in Fabry's disease in 4Q26.
- Japan launch of **RYTM's setmelanotide** in acquired hypothalamic obesity (aHO) by year end.
- EU launch of **RYTM's setmelanotide** in aHO in 2027.

See within for additional details

Additional details on upcoming catalysts:

- **Phase 1 data of SRRK's SRK-439 in healthy volunteers** by year-end to assess safety and tolerability profile of SRK-439 and PK/PD profile. Note that SRK-439 is more potent than apitegromab and it's been optimized for subcutaneous formulation.
- **CHMP opinion on apitegromab in SMA is now expected in 1H27** following resubmission of the MAA earlier this week (see our note HERE). We had anticipated that FDA approval would provide meaningful validation of the alternate fill-finish facility, further strengthening our confidence in a positive CHMP opinion in 1H27.
- **Clarity on the pivotal trial design for BNTC's BB-301 in OPMD is now expected in 1Q27** (vs. prior guidance of 3Q26/4Q26), following an FDA request for 12-month natural history data in addition to the previously submitted 6-month dataset. The company expects to provide an update following FDA alignment on the proposed design.
- **LRMR remains on track to complete its rolling BLA submission for nomlabofusp in FA in 2H26, seeking accelerated approval based on skin FXN levels.** We see a credible path to approval given encouraging efficacy data, CMC readiness, and constructive FDA engagement, although the safety database remains the key risk and could modestly delay review (LINK).
- **Novartis (NVS, Not Rated)/PTCT plan to engage with the FDA to discuss the emerging clinical data for votoplam, including the 24-month results from PIVOT-HD trial demonstrating ~50% slowing of disease progression versus matched ENROLL-HD natural history controls.** That said, our base case conservatively assumes a Phase 3 trial will be required for approval. Importantly, the ongoing Phase 3 INVEST-HD trial incorporates key learnings from Phase 2 PIVOT-HD, particularly around patient selection, which we believe increases the likelihood of clinical success.
- **PTCT remains on track to complete the rolling BLA submission for accelerated approval of the recently acquired ST-920 from Sangamo (SGMOQ, Not Rated) in 4Q26.**
- **RYTM expects to launch setmelanotide in aHO in Japan by year-end 2026.** We view Japan as a meaningful commercial opportunity, with an estimated 5,000–8,000 patients and potentially favorable pricing expected to fall between U.S. and European levels.
- **RYTM is poised to begin a country-by-country rollout of setmelanotide across Europe for setmelanotide in aHO**. Note that the EU opportunity is significant with a population size ranging from 8,000-10,000 patients.

BNTC INVESTMENT THESIS

Our investment thesis is four-fold:

- There is a clear unmet need in OPMD with no approved disease-modifying therapy to date, and no competition and only limited symptomatic options for dysphagia, a major driver of poor quality of life and mortality.
- We believe BB-301's differentiated "silence-and-replace" strategy is well suited to address the underlying pathophysiology of OPMD with the potential to provide durable therapeutic benefit.
- There are ~3,000 patients in the US and ~15,000 patients worldwide, with a strong founder effect leading to concentrations of patients in Quebec, Canada, among Bukhara Jews and at high-volume centers including NYU and UNM.
- The company is aiming to obtain FDA alignment on the Phase 3 study design, including a company-sponsored natural history lead-in period within a single-arm design and an endpoint strategy incorporating both objective and patient-reported outcomes.

VALUATION

Our $18 PT is based on an SOTP analysis that forecasts cash flows into the late 2040s, with a 12% discount rate.

RISKS TO VALUATION

Risks to our outlook and valuation include:

- Setbacks in the clinical development of BNTC's only program, BB-301,
- Safety signals in the clinical development of BB-301 that would deter commercial adoption,
- Competitive threats in the gene therapy and RNAi spaces from other emerging biotech companies, and
- Greater-than-expected operating expenses and cash burn, resulting in equity issuances more frequently or at a less attractive valuation than we project.

CAMP INVESTMENT THESIS

- SRD represents a high-unmet-need genetic disorder driven by SYNGAP1 haploinsufficiency, with no approved disease-modifying therapies and current treatment limited to symptomatic management.
- CMP-002 offers a compelling disease-modifying approach by targeting regRNA to increase endogenous SYNGAP1 expression and restore protein levels; importantly, the program is currently leading the competitive development landscape.

- CMP-002 leverages an established CNS therapeutic modality, with intrathecal ASO delivery clinically validated by approved therapies including Spinraza and Qalsody, helping reduce modality and delivery risk.
- Beyond CMP-002, we see meaningful unmodeled upside from potential BD/licensing of CMP-001 in UCD and additional programs generated through CAMP's proprietary RAP platform, which is very versatile. We currently ascribe no explicit value to these opportunities despite clinical data already generated for CMP-001.

VALUATION

Our $14 PT is based on a SOTP analysis that forecasts cash flows into the early 2040s, with a 12% discount rate.

RISKS TO VALUATION

- Disease heterogeneity could make it challenging to demonstrate a clear and consistent efficacy signal across patients.
- Clinical benefit could be largely confined to seizure reduction, with limited improvement in more meaningful behavioral and cognitive outcomes, potentially constraining adoption.
- Unmodeled competitive entrants, including potentially disruptive therapeutic modalities, could reduce CMP-002's addressable market and commercial opportunity.
- Unexpected safety findings, particularly those that limit dosing or chronic administration, could negatively impact the program's development and commercial potential.

LRMR INVESTMENT THESIS

1 The company's only product, Nomlabofusp, is differentiated by directly addressing the underlying FXN deficiency in FA, delivering mature FXN to mitochondria and restoring levels toward those seen in asymptomatic carriers. In contrast, Skyclarys acts downstream of the core defect, leaving substantial unmet need for an upstream disease-modifying therapy.

2 In our view, we believe nomlabofusp's benefit-risk profile is favorable, with sustained FXN restoration through 18 months, encouraging and potentially deepening clinical benefit across mFARS and other functional measures, and supportive long-term exposure data at the 50 mg dose. While anaphylaxis remains the key safety risk and could necessitate a boxed warning and/or REMS upon approval, potentially limiting adoption, we believe the risk is manageable through modified dosing and mitigation strategies and is unlikely to meaningfully constrain use given the high unmet need and encouraging efficacy profile.

3 We believe the current BLA package has a credible path to accelerated approval, supported by FDA alignment on skin FXN as a surrogate endpoint (pending review), encouraging functional data, a well-advanced CMC package, and continued constructive agency engagement. The key remaining risk is the safety database, which could modestly delay review if additional follow-up is required, although management believes this could

be addressed through a 90-day safety update or major amendment (adding ~3 months) rather than a new application.

VALUATION

Our $13 PT is based on an SOTP analysis that forecasts cash flows into the early 2040s, with a 12% discount rate.

RISKS TO VALUATION

- High anaphylaxis risk in real world that substantially negatively impacts adoption
- Long-term safety concerns emerge with chronic administration, particularly injection-site tolerability or immunogenicity
- Competition from gene therapy, gene editing or other FXN-restoring approaches that offer superior efficacy or dosing convenience
- Changes in commercial health plans, Medicare and Medicaid
- Confirmatory Phase 3 fails to replicate the positive biomarker and functional outcome
- Regulatory delays could pressure the shares given the current cash runway through only 2Q27

PTCT INVESTMENT THESIS

1 We believe Sephience can sustain long-term top-line growth and offset declines in the legacy DMD franchise, supported by its differentiated clinical profile, encouraging U.S. launch trends, positive KOL feedback, and ex-U.S. opportunity. Importantly, continued execution should help establish a sticky base of well-controlled patients ahead of potential competition from oral selective SLC6A19 inhibitor in 2028-2029.

2 We view votoplam as a compelling HD opportunity, supported by robust mHTT lowering, an encouraging dose-dependent cUHDRS trend, and a favorable safety and convenience profile. We conservatively assume Phase 3 will be required for approval. Importantly, the Phase 3 design incorporates key lessons from PIVOT-HD, increasing our confidence in the program's likelihood of success.

3 We see meaningful medium-term pipeline optionality across multiple programs, including vatiquinone in Friedreich's ataxia (FA), oral small-molecule programs targeting NLRP3 in pulmonary inflammatory diseases, second-gen DHODH, as well as gene therapy in Fabry disease. Importantly, PTC continues to leverage its expertise in oral small-molecule and splicing platforms targeting MSH3 (to stall CAG expansion in HD in a manner upstream of votoplam's MoA) and ATXN3 to expand into several high-unmet-need indications. We assign a 75% POS to vatiquinone in FA, with limited value currently ascribed to NLRP3 and Fabry, leaving upside as these programs are further de-risked.

4 Strong cash position should support BD opportunities to diversify the revenue base, and it continues to demonstrate disciplined expense management and remains on track toward potentially achieving cash flow breakeven in 2026.

VALUATION

Our $98 PT is based on an SOTP analysis that forecasts cash flows into the mid 2040s, with a blended 10% discount rate.

RISKS TO VALUATION

- Sephience's growth slows down and persistence is negatively impacted by near-term competition.
- Otsuka's repinatrabit captures meaningful share from Sephience.
- Negative data from INVEST-HD for votoplam.
- Lack of meaningful clinical validation from the pipeline.

RYTM INVESTMENT THESIS

1 **Rhythm's differentiated MC4R agonist franchise addresses significant unmet need across rare obesity disorders driven by impaired MC4R pathway signaling and requiring specialized management distinct from general obesity care.** Its first-generation product, setmelanotide, is approved in Bardet-Biedl syndrome and several biallelic monogenic obesity indications and was recently approved in acquired hypothalamic obesity (aHO), a meaningful opportunity encompassing ~25,000 patients across the U.S., Europe, and Japan.

2 **We are positive on the aHO opportunity given the significant unmet need and limitations of current treatment options.** Off-label GLP-1 receptor agonists benefit some patients but primarily address weight, whereas MC4R agonists can improve both weight and hyperphagia. We model >$2B in peak sales for aHO, incremental to +$500M from the previously approved monogenic obesity indications. Early launch trends are encouraging, with management executing well on market access, and we expect strong U.S. momentum to continue into 2027 alongside the ex-U.S. rollout beginning YE 2026. Rhythm is also developing second-gen assets with improved safety and convenience that could enhance persistence and drive upside to our estimates.

3 **We are optimistic about the potential expansion into Prader–Willi syndrome (PWS), supported by a strong biological rationale and recently reported positive six-month data.** Based on an estimated ~8,500–12,000 PWS patients with hyperphagia/obesity across the U.S. and EU, we conservatively model >$1B in global peak sales. We expect additional data by YE2026 (not formally guided) and in 2027 to further de-risk the opportunity, driving further upside to the stock.

4 **Beyond the core MC4R franchise, we see meaningful unmodeled optionality from the congenital hyperinsulinism program** acquired from Xinvento, which expands

Rhythm into adjacent rare endocrine disorders. We currently ascribe no explicit value to this opportunity, creating potential upside as the program advances.

VALUATION

Our $133 PT is based on an SOTP analysis that forecasts cash flows into the 2040s, with a blended 10% discount rate.

RISKS TO VALUATION

- Payer pushback limits access
- A competitive product comes to market with better results and better economics
- Subpar weight-loss efficacy relative to existing treatments, including GLP-1 receptor agonists
- Continued Medicare reimbursement headwinds.

SRRK INVESTMENT THESIS

- Lead asset apitegromab addresses a key unmet need in spinal muscular atrophy (SMA), offering a complementary approach to SMN-targeted therapy by providing increased muscle function and mass. We believe Scholar Rock is positioned to deliver a strong commercial ramp given the expected high demand.
- The well-established market and favorable reimbursement environment in SMA should enable rapid adoption of apitegromab into standard of care, and over time support a (well above consensus) multi-billion-dollar commercial opportunity.
- The company is also developing apitegromab in FSHD. While we believe the program has a plausible scientific rationale, we continue to assign a relatively low probability of success given the disappointing track record of prior anti-myostatin therapies in the indication. As such, we attribute only modest value to the FSHD program in our valuation.
- SRRK is well positioned to expand apitegromab (and subcutaneous follow-on SRK-439) into other rare muscular dystrophies. We also take partnership/BD interest in muscle sparing obesity applications as unmodeled upside to our valuation.

VALUATION

Our $65 PT is based on a SOTP analysis that forecasts cash flows into the late 2040s, with a 10% discount rate.

RISKS TO VALUATION

Risks to our outlook and valuation include:

- Clinical or regulatory setbacks for apitegromab in spinal muscular atrophy, including continued review delays or receipt of another CRL due to efficacy, safety or manufacturing defects.
- Competitive threats from SMN-targeted and other anti-myostatin therapies approved and/or in development for spinal muscular atrophy.
- Greater-than-expected operating expenses and cash burn could lead to dilutive equity issuances more frequently or at a less attractive valuation than we project.
- Major changes in reimbursement coverage for add-on therapies, or unexpected safety signals for apitegromab or the anti-myostatin class in general.

Explanation of Ratings

Outperform (Buy): We expect this stock to outperform its benchmark over the next 12 months.

Market Perform (Hold/Neutral): We expect this stock to perform in line with its benchmark over the next 12 months.

Underperform (Sell): We expect this stock to underperform its benchmark over the next 12 months.

The degree of outperformance or underperformance required to warrant an Outperform or an Underperform rating should be commensurate with the risk profile of the company.

For the purposes of these definitions the relevant benchmark for "Leerink Partners" branded healthcare and life sciences equity research will be the S&P 600® Health Care Index for issuers with a market capitalization of less than $2 billion and the S&P 500® Health Care Index for issuers with a market capitalization over $2 billion.
